SUMMARY

Erian Toni. Analysis of the Quality and Food Safety of Tongkol Fish Crackers (*Euthynnus affinis*) in South Bunguran District, Natuna Regency. Supervised by Jumsurizal and Sri Novalina A.

Tuna fish has very good nutritional content for body growth. Low fat content and calories rich in protein and omega-3 make tuna very popular. Proximate testing, T1 treatment (Central Cemaga Tuna Fish Crackers) for water content (8.03%), ash content (4.70%), protein content (32.62%), fat content (0.95%) and carbohydrates (53.71%). T2 in North Cemaga village contains water content (15.50%), ash content (4.26%), protein content (15.10%), fat content (0.71%) and carbohydrate content (64.44%). T3 in Cemaga village water content (11.60%), ash content (4.58%), protein content (19.18%), fat content (0.68%) and carbohydrate content (63.97%), and T4 in West Cemaga village water content (11.74%), ash content (2.80%), protein content (21.47%), fat content (0.76%), and carbohydrates (63.24%) In testing for formalin in four villages got negative results, while the borax test also got negative borax results. Tuna fish crackers (*Euthynnus affinis*) were selected at T1, namely in Central Cemaga Village, Natuna Regency, because the protein content was higher compared to T2, T3 and T4, the nutritional adequacy figures obtained and referring to the regulations set by BPOM 2016 were only able to meet nutritional needs daily in the body in small amounts, the nutritional value obtained in total energy is 70.77 kcal, protein 10.87 g, total fat 0.28 g, carbohydrates 3.31 g.
